#### **Characterising South Australia's Cover**

- 'Characterising South Australia's Cover' one of 4 key teams at the Geological Survey of South Australia
- Key area of focus will be:

   Providing new and updated data compilations
  - Lead with innovative geoscience products
- Ensure that stakeholders will be able to explore with improved confidence and vigour in some of the most underexplored regions of the state.

### Current Surface Geochemistry Database

- All sample points calcrete
- Also in database vegetation, lag, stream sediments etc
- Lack of data where cover assumed 'too thick'
- If GSSA can't confidently show data for these areas – how do we attract stakeholders to be interested?

→ Image – Data from March 2018

Mining

GeoChem Extract allows downloads of geochemistry data for the entire State, a selected map sheet, or any area d Data from the WACHEM database, as well as public company surface geochemistry, can be queried spatially and

GSWA geochemical datasets include geochemistry for bedrock and regolith. The latter comprise more than 20,000 programs.

#### **Depth of Cover – Depth to Basement Maps**

- 100 m depth not the end of the geochemical survey program!
- GSSA collaborations test surface geochemistry in areas
   > 100 m (far west, northeast SA)
  - Coompana Geochemical
    Survey (2017 CSIRO)
  - Regional Biogeochemical Survey of the Eucla Basin (2014 – Dunn & Waldron)

### Reasons Why We Need Baseline Surface Geochemistry

- Mineral explorers currently use a variety of sampling media (e.g. different soil fractions, lag, biota)
- Previous case studies (e.g. Butt et al. 2005) and geochemical surveys undertaken in SA by CRCLEME and DETCRC
- Easy access to geochemical = assisting mineral explorers in determining:
  - Appropriate sampling media for exploration programs
  - ✓ Give confidence and assurance to those working in greenfield areas

#### Reasons Why We Need Baseline Surface Geochemistry 2

Establish baseline geochemistry across all of SA's geological provinces, for each popular sampling media will allow a complete update of the quality and accessibility to surface geochemical

# PRECOMPETITIVE DATA & ENVIRONMENTAL REFERENCE

### How will we do this?

- Clean up existing data and make it available via SARIG
- Assemble updated state-wide geochemical datasets
  - ✓ Include sampling media type
  - ✓ Individual elements
- A regional geochemistry dataset for many types of sampling media
- Any gaps in this coverage will be prioritised & reconnaissance traverses planned (aligned with MinEx CRC and UNCOVER project work)

## Thankyou!
